
FUNCTIONALITY & WORKFLOW GUIDE

CareOps Intelligence

A complete walkthrough of every page, feature, and end-to-end workflow in the platform — what each screen does, who can use it, and how the pieces (risk scoring, alerts, the graph, AI summaries) connect to one another.

Repository: github.com/kavyasmehta/careops-intelligence

Portfolio demonstration using synthetic data. Not intended for clinical use or storage of protected health information.

Contents

1. **Roles & the demo entry screen**
2. **Page-by-page functionality** — Dashboard, Work Queue, Client Directory, Client 360, Eligibility Center, Authorization Tracker, Appointment Monitor, Alert Center, Network Intelligence, Analytics
3. **Risk scoring, explained**
4. **Automatic alert generation**
5. **AI case-summary generator**
6. **End-to-end workflows** — 7 walkthroughs tying the pages together
7. **Permissions matrix**

1 Roles & the demo entry screen

There is no real login. The entry screen lets you enter the app as one of three fictional demo users, each mapped to a role that controls what you can see and do. Every request the frontend makes carries this role in a header, checked on the backend before any action is allowed — so the restrictions described throughout this document are enforced server-side, not just hidden in the UI.

Operations Manager full visibility, all analytics, triggers alert generation, the only role that can create alerts or tasks directly.

Intake Specialist manages clients and eligibility checks.

Authorization Specialist manages authorizations and appointments.

Every screen in the app — and every AI-generated case summary — carries a persistent banner: *"Portfolio demonstration using synthetic data. Not intended for clinical use or storage of protected health information."*

2 Page-by-page functionality

Executive Dashboard OM IS AS

The landing page after entry. Shows top-line KPIs — active clients, open high-priority alerts, authorizations expiring soon, failed eligibility checks — plus trend charts, a payer-performance breakdown, and team/workload summaries. Filterable by team, payer, and client status. This is the "how is the operation doing right now" view.

Operations Work Queue OM IS AS

A single prioritized table combining every open alert and task across the whole client population, filterable by severity and status. This is the "what should I work on next" view — the natural starting point for a daily shift, and the page most workflows in this document begin from.

Client Directory OM IS AS

A searchable, filterable, paginated list of every client (by name, status, or assigned team). Operations Managers and Intake Specialists can create a new client or edit an existing one in place from this page; clicking a row opens that client's full profile.

Client 360 OM AS IS

The complete record for one client, organized into tabs:

Tab	Contents
Overview	Contact info, care team/assignment, the client's current operational risk score with its top contributing factor, and the AI case-summary generator.
Eligibility	Full history of insurance eligibility checks for this client.
Authorizations	Every prior authorization: units approved/used, status, expiration.
Appointments	Scheduled and past appointments, and which authorization (if any) each is linked to.
Alerts & Tasks	Every alert and follow-up task tied to this client, with inline assign/resolve/complete actions.
Notes	Free-text case notes, newest first — the running narrative of what staff have done for this client.
Audit	A full, timestamped audit trail of every create/update action ever taken on this client's record, across every entity.

Eligibility Center OM IS

All eligibility checks across all clients in one filterable table (by coverage status — passed/failed/pending). Operations Managers and Intake Specialists can log a new eligibility check here.

Authorization Tracker OM AS

All prior authorizations across all clients, filterable by status, with expiring and nearly-exhausted authorizations easy to spot. Operations Managers and Authorization Specialists can create or update an authorization here.

Appointment Monitor OM IS AS

All appointments across all clients, filterable by status and provider — the page that makes "which upcoming appointments have no valid authorization linked" visible at a glance.

Alert Center OM IS AS

Every alert in the system — system-generated and manually created — filterable by severity and status. Any role can assign or resolve an alert (with required resolution notes); only an Operations Manager can create a new alert directly or trigger the automatic generation sweep (Section 4).

Network Intelligence OM IS AS

The Neo4j-powered page. Pick a client to render their **ego network** — a hand-drawn radial graph centered on that client, showing their assigned employee, payer, risk factors, and recent appointments/authorizations as connected nodes. Alongside it, a "clients with similar risk patterns" panel surfaces other clients who share the same risk factors — a graph traversal a relational query would struggle to express cleanly.

Analytics OM

Operations-Manager-only. Trend lines, payer-performance comparisons, workload distribution across employees/teams, and alert-resolution-time metrics, each exportable to CSV for offline analysis.

3 Risk scoring, explained

Every client has an operational risk score from 0–100, banded into **Low** (<25), **Medium** (≥25), **High** (≥50), or **Critical** (≥75). It is deliberately *not* machine learning — it's a transparent sum of named, weighted factors, so any user can see exactly why a client scored the way they did on that client's Overview tab.

Factor	Points
Upcoming appointment without a valid authorization	25
Latest eligibility check failed	20
Authorization expiring within 14 days	15
Authorization units nearly exhausted (≥90% used)	15
Coverage termination date within 30 days	15
Multiple (2+) unresolved alerts	15
Overdue operational task	15

Points sum and cap at 100. The same underlying conditions drive automatic alert generation (Section 4), so the numeric score and the alert queue can never disagree with each other.

4 Automatic alert generation

From the Alert Center, an Operations Manager can trigger a one-click sweep that scans every client against seven defined conditions (the same six risk factors above, plus a "multiple concurrent issues" escalation trigger) and creates an alert for anything not already covered by an existing open alert of that type for that client.

Safe to run repeatedly. Duplicate prevention is enforced by the same check the manual "create alert" action uses, so re-running the sweep never produces two alerts for the same underlying problem.

Every alert carries a plain-language explanation and a recommended action (e.g. *"Authorization AUTH-04821 expires in 3 days — submit a renewal request to the payer before expiration"*), and every system-generated alert is written to the audit log under a distinct system user.

5 AI case-summary generator

From a client's Overview tab, "Generate" produces a plain-language operational snapshot of that client's current record — status, risk factors, recent activity — for a case worker to read in seconds instead of clicking through every tab.

- **Default (always on, zero setup):** a deterministic template assembles the summary from the client's actual data. No API key, no external network call, always available.
- **Optional upgrade:** setting `ENABLE_LLM_SUMMARY=true` with a valid API key switches to a real LLM rewrite of the same underlying facts.

In both modes, generated summaries are visibly labeled as generated, are built only from the client's own operational data, and never contain a clinical recommendation.

6 End-to-end workflows

Workflow 1 — Intake a new client

- 1 Enter as **Intake Specialist** (or Operations Manager).
- 2 Open **Client Directory** → "New client."
- 3 Fill in demographics, member ID, and status; assign a team/employee if known.
- 4 Save — the client immediately appears in the directory and gets a Client 360 page, starting with a Low risk score (no factors triggered yet).

Workflow 2 — Check eligibility and see the risk score react

- 1 Enter as **Intake Specialist**.
- 2 Open **Eligibility Center** → "New check," record a failed result for a client.
- 3 Open that client's **Client 360** → **Overview** tab — the risk score has increased and lists "Latest eligibility check failed" as a contributing factor with the specific reason.
- 4 Run the alert-generation sweep (as Operations Manager) — a new alert now appears for that client in the Alert Center.

Workflow 3 — Track an authorization to renewal

- 1 Enter as **Authorization Specialist**.
- 2 Open **Authorization Tracker**, filter to authorizations expiring soon.
- 3 Open the linked client's profile, review the Authorizations tab for units used/approved.
- 4 Update the authorization's status once renewed — the risk factor and any related alert clear automatically on the next view/sweep.

Workflow 4 — Work the queue end to end (the core daily loop)

- 1 Enter as **Operations Manager**.
- 2 Open **Work Queue**, filter to Critical severity and Open status.
- 3 Select the top case, open the linked **Client 360** profile, and review the Alerts & Tasks tab for full context.
- 4 Go to **Alert Center**, find the same alert, click Resolve, and record resolution notes.
- 5 Return to the **Dashboard** — the "open high-priority alerts" KPI has decremented, confirming the resolution took effect system-wide.

Workflow 5 — Explore a client's network

- 1 Open **Network Intelligence** and select a client from the picker.
- 2 Review the ego graph: assigned employee, payer, and risk-factor nodes radiating from the client at center.
- 3 Check the "clients with similar risk patterns" panel to see who else shares those same risk factors — useful for spotting a systemic issue (e.g. many clients failing eligibility with the same payer) rather than a one-off.

Workflow 6 — Generate an AI case summary

- 1 Open any client's **Client 360** → **Overview** tab.
- 2 Click **Generate** under Case Summary.
- 3 Read the plain-language snapshot — labeled as generated, built only from that client's own record.

Workflow 7 — Review operational trends

- 1 Enter as **Operations Manager**, open **Analytics**.
- 2 Review trend lines, payer performance, and workload distribution.
- 3 Export the relevant view to CSV for offline reporting.

7 Permissions matrix

Action	Operations Manager	Intake Specialist	Authorization Specialist
View all pages & read data	✓	✓	✓
Create / edit clients	✓	✓	—
Create / edit eligibility checks	✓	✓	—

View Network Intelligence / graph insights	✓	✓	✓

These restrictions are enforced by the backend on every request (via the `X-Demo-Role` header), not only hidden in the frontend — attempting a disallowed action returns an HTTP 403, regardless of which UI path was used to reach it.

CareOps Intelligence — portfolio demonstration using synthetic data. All screenshots, data, and organizations referenced are fictional. See the project README for architecture, data models, and setup instructions.
